Test Summary

1. Testing Performed

Testing focused on the main workflows in AbleSpace , including Student management workflow,Signup/Login, Caseload management, Student and Guardian forms, Groups, Service Time tracking, Family Center, Refer & Earn, and page navigation. I tested both Standard Table View and Compact Card View to check whether features worked correctly in different layouts.

I also checked the application's layout and functionality using Desktop Google Chrome, Desktop Microsoft Edge, mobile view (390 × 844 emulation), and iPad Mini and iPad Pro viewport sizes. Testing included form validation, data accuracy, basic feature functionality, and layout consistency across these environments.

2. Issues Found

Testing revealed several issues, including problems with group membership after restoring an archived student, frontend validation messages, avatar rendering, and responsive layouts. The UI issues included required-field warnings disappearing when whitespace was entered into name fields (BUG-03), profile avatars appearing blank when names contained leading spaces (BUG-02), Horizontal misalignment of the Service Time filter button in Standard View, a missing + icon in the Family Center header in Compact View, off-center text on the "Add Goal" button, and clipped text on the "Copy Link" and "Send Email" buttons in the iPad Mini layout.

I would prioritize the group membership issue first because a restored student does not automatically return to their previous group. This could leave a class roster incomplete and require teachers to add the student back manually. I would confirm the expected behavior with the team, as it was not specified. Next, I would prioritize BUG-03 because the required-field warnings disappear even though the application correctly prevents invalid submissions.

3. Areas Not Tested

Testing was limited to the selected workflows and browser/device configurations. Subscription upgrades and payment processing were not tested to avoid triggering billing-related actions in the staging environment. Performance under heavy usage, accessibility testing, and detailed security testing were outside the scope of this manual testing exercise.

4. What I Would Test Next

With another 1–2 hours, I would test whether different user roles, such as Admin, Teacher, and Therapist, can access the correct features and student information. I would also test PDF and CSV exports, session timeout behavior, and what happens to unsaved form data when the network connection is interrupted. These tests could help uncover more issues that affect student records and teachers' daily work.
